| Genre                                              | 3D First-Person Escape Room              |                                                                   | Engine       | Godot 4.x (Compatibility / WebGL)          |  |
| Target Playtime                                    | 10 – 15 Minutes (3 Zones)                |                                                                   | Platform     | Web (Itch.io HTML5) & Windows PC           |  |
| Visual Style                                       | Cel-shaded comic, ink outlines, halftone |                                                                   | Core Control | WASD, Mouse Look, Space (Float), E         |  |

## 1. The Simple Concept

You are trapped inside an interactive, illustrated comic book vault. A broadcast announces that you must find a legendary '**Comic Book Issue #1**' to unlock the exit door. Using regular walking combined with an **Anti-Gravity Floating power**, you navigate past hazards, reach high shelves, and solve spatial puzzles to retrieve the comic.

## 2. Core Mechanics in Plain Terms

|                       |                                                                                                                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| First-Person Movement | Smooth walk, look around, inspect objects, and press buttons using the standard 'E' key.                                                                                                          |
| The Floating Power    | Press <b>Space / F</b> to invert gravity. Your character gently floats upward with high damping, letting you fly over laser tripwires, reach high ventilation shafts, and access upper balconies. |
| Floating Stamina Bar  | A simple comic gauge restricts infinite flight. You must plan your float paths between safe landing pads.                                                                                         |
| Comic Feedback        | Sound effects generate bold visual comic onomatopoeia billboards (e.g. <i>*WHOOSH*</i> when floating, <i>*CLICK*</i> on switches, <i>*CREAK*</i> on doors).                                       |

## 3. The 3 Playable Zones (10–15 Minutes Total)

|                                |                                                                                                                                                                           |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Zone 1: The Gutter (Tutorial)  | A basic two-story archive room. Teaches movement and the float ability to reach a switch high on a catwalk.                                                               |
| Zone 2: The Grid (Navigation)  | A vertical, multi-tiered puzzle room. Use fans, float over tripwires, and place weighted boxes on pressure plates to unlock the safe holding <b>Comic Book Issue #1</b> . |
| Zone 3: Splash Page (The Exit) | A dramatic catwalk crossing over an abyss leading to a giant, intimidating steel blast door covered in caution tape.                                                      |

## 4. The Big Meta-Twist (The Punchline)

**The Subversion:** After 15 minutes of floating and solving puzzles to bring Issue #1 to the exit, the player interacts with the monolithic door. The massive metal lock is actually a flat cardboard cutout, and the door swings open freely with a tiny squeak (*\*CREAK...\**). **The door was never locked all along!** The game ends with a humorous comic book splash page celebrating the player's over-complicated journey.

# PROJECT EXECUTION & JAM ROADMAP

100-Hour Milestone Schedule, Compliance Rules & Technical Stack

## 5. The 100-Hour Jam Production Schedule

| Hours    | Phase                         | Key Deliverables & Milestones                                                                                                               |
|----------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| 0 – 10   | Setup & Scope Lock            | Create fresh Git repository, configure Godot 4.x project settings, establish folder architecture, lock mechanics scope.                     |
| 10 – 40  | Core Controller & Graybox     | Build first-person character movement, mouse look, raycast interaction (doors, buttons), and block out primitive geometry for all 3 zones.  |
| 40 – 70  | Floating & Puzzle Logic       | Script the anti-gravity float toggle, float meter, laser hazards, fan drafts, pressure plates, and Issue #1 pickup.                         |
| 70 – 90  | Assets, Comic Art & Audio     | Implement cel-shade & ink outline post-processing, import CC0 3D models (Kenney.nl), add comic speech bubbles, UI gauge, and sound effects. |
| 90 – 100 | Testing, Web Export & Itch.io | Test HTML5 WebGL export across browsers, tune jump/float balance, capture screenshots/GIFs, complete README and CREDITS.md, submit to jam.  |

## 6. Strict Jam Compliance & Asset Provenance

| Rule Requirement       | Project Adherence & Action Plan                                                                      |
|------------------------|------------------------------------------------------------------------------------------------------|
| Fresh Codebase         | Zero pre-existing code templates. All scripts written from scratch after the jam clock begins.       |
| Public GitHub Repo     | Hosted publicly with clear, incremental commit history demonstrating 100-hour progression.           |
| 100% Free / CC0 Assets | 3D environment props from Kenney.nl (CC0), SFX from Freesound.org (CC0), open fonts (SIL OFL).       |
| Attribution Document   | Maintained <b>CREDITS.md</b> listing exact URLs, author names, and licenses for every external file. |

## 7. Jam Feasibility & Why This Succeeds

- **Laser-Focused Scope:** 3 small rooms and 1 hero mechanic prevent feature creep within 100 hours.
- **Instant Web Playability:** Godot 4 Compatibility renderer enables one-click play in browser, maximizing jam judge ratings.
- **Memorable Punchline:** The unlocked-door twist creates an emotional and comedic payoff that stands out in game jams.
- **Modular Contingency:** If time runs tight, Zone 2's laser puzzle can be simplified without hurting the narrative payoff.

**Development Team:** G. Suchith Reddy | Thadikonda N V V D Malleeswari | Adithya Thakur

*ComicEscape* is achievable in 100 hours, visually striking, fully jam-compliant, and delivers an unforgettable meta-twist.
